

SuperApplication

Hello, Fellowship!

You're in the great wonderland of my assignment project!

Here's a brief explanation of what is what.

There's a project called `SuperApplication`. You should launch it only by opening `.xcworkspace` as long as I was using `CocoaPods` to complete the task. Frameworks that I've been using are `SwiftyJSON` (to handle the JSON data) and `Alamofire` (to perform clean http requests).

`Task 1` is located in the same project in the `MyPlayground.playground` file.

`Task 2` is in the pdf-file named `Task 2.pdf`

Also, please, run the app with the appropriate scheme. Enable location simulation and set the default location to the city of your choice!

Comments to code are provided.

May the force be with you,
Philip.
